Management Fee	0.50% p.a.	Fund Issuer	Fidante Partners Limited

Fund Overview

The ActiveX Ardea Real Outcome Bond Fund (Managed Fund) is a defensive fixed income solution that targets stable returns exceeding cash deposit rates and inflation, with a quarterly income distribution and daily liquidity.

The Fund does this by employing Ardea's 'relative value' investment approach, which combines the safety of high quality government bonds with proven risk management strategies to deliver low volatility returns, while protecting capital from interest rate fluctuations and general market volatility. (Note: neither the Fund nor the Underlying Fund are guaranteed).

Suits Investors Seeking

- a higher expected return than bank deposits¹
- an alternative source of income, with low volatility
- a defensive fixed income anchor to diversify portfolio risk away from equities, property and credit investments
- investors who accept some risk and that their investment will include exposure to derivative strategies

¹ Neither fund performance nor capital is guaranteed.

Monthly Performance Report – 30 November 2020

Fund Performance ^{2, 3}	1 month	3 months	FYTD	1 year	3 years	5 years	Since inception ⁴
Fund	0.38%	1.51%	2.78%	5.86%	-	-	7.36%
Australian Consumer Price Index	0.10%	0.65%	1.71%	0.36%	-	-	1.06%
Excess Return	0.28%	0.86%	1.07%	5.50%	-	-	6.29%

² Performance figures are based on the Fund's net asset value, are calculated after fees have been deducted and assume distributions have been reinvested. No allowance is made for tax when calculating these figures. Past performance figures that are less than 12 months are for informational purposes only and are not to be relied upon when considering the likely future performance of the fund.

³ The performance of the Fund will not exactly replicate that of the Underlying Fund, for example, where cash is held by the Fund

⁴ The Fund's inception date is 10 December 2018.

Fund Benefits

Higher expected returns than cash and term deposits¹

The Fund has a track record of delivering returns exceeding cash, term deposits and inflation since inception². As these returns are independent of market direction, Ardea expects to maintain a level of outperformance in rising and falling markets irrespective of the level of cash or deposit rates.

An easier way to access your investment

The Fund offers daily trading on the ASX, without break costs that can apply to term deposits.

Lower risk than many common investment income sources

The Fund invests in high-quality government bonds and cash securities, which have lower credit risk, unlike bank hybrids and corporate bonds, while also using sophisticated risk management strategies to minimise volatility compared to dividend paying stocks.

Defensive fixed income anchor that helps diversify investment portfolio risk

The Fund targets positive returns that are independent of interest rate fluctuations and general market volatility. Combining this with proven risk management strategies allows the Fund to help diversify your portfolio risk away from equities, property and credit investments.

Protect the purchasing power of your cash

In addition to outperforming³ bank deposits, the Fund targets returns exceeding inflation, which helps protect the long term purchasing power of your cash.

Experienced and stable investment team: Ardea's investment team has decades of experience across global fixed income markets. Majority employee ownership of the Ardea business fosters team stability.

Fund Risks

The Fund is exposed to a number of risks including interest rate risk, market risk, and collateral risk. Please refer to the Product Disclosure Statement for more information.

1 Neither fund performance nor capital is guaranteed.

2 Inception date is July 2012. Past performance is not an indicator of future performance.

Monthly Commentary

Notable events for the month are summarised below and more detailed discussions of topical market themes are available here - [Ardea's market insights](#).

What happened?

In November, investor focus switched from votes to vaccines, which powered equities to new highs – most major indices posted double-digit gains and some made new monthly records. In contrast, the USD index and gold underperformed notably. The pro-risk backdrop had only modestly bearish implications for government bonds.

Chart 1: Equity melt-up vs bond yield containment

Source: Ardea, Bloomberg

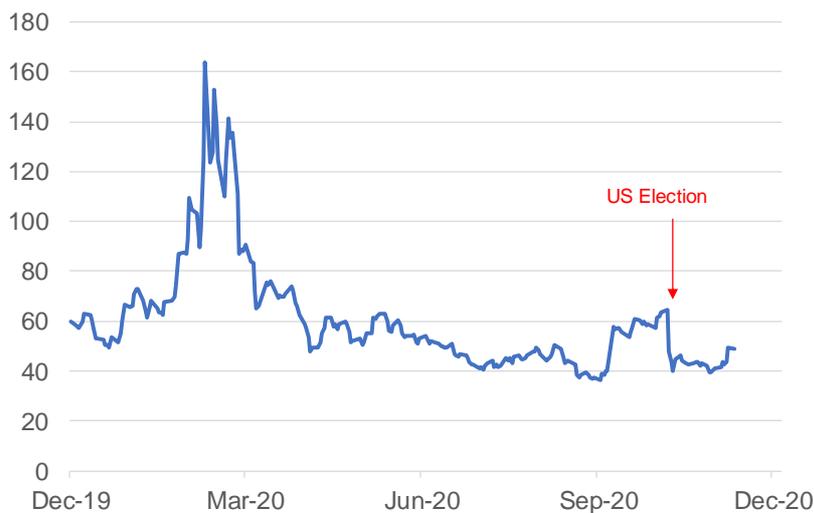

We outline three key developments over the month.

1) The blue wave turned out to be more of a blue ripple for markets

The lead-up to the 2020 US election showed heightened investor focus on the prospects of a *Blue Wave* outcome, whereby Democrats take control of both houses of the US Congress. The upshot for markets was thought to be significantly more fiscal stimulus – bullish for stocks, but bearish for bonds. In the event, Biden claimed victory, although without a clear blue wave (at the time of writing some senate seats were still being contested). A transition process is underway for the Biden presidency.

The passing of this key event risk gives markets some confidence to the extent that political uncertainty has been reduced which is positive for sentiment. But markets have had to lower the probability of large-scale US fiscal spending, the clearest implication of which was a temporary sharp fall in long term US bond yields and a more sustained drop in measures of US rates volatility (Chart 2).

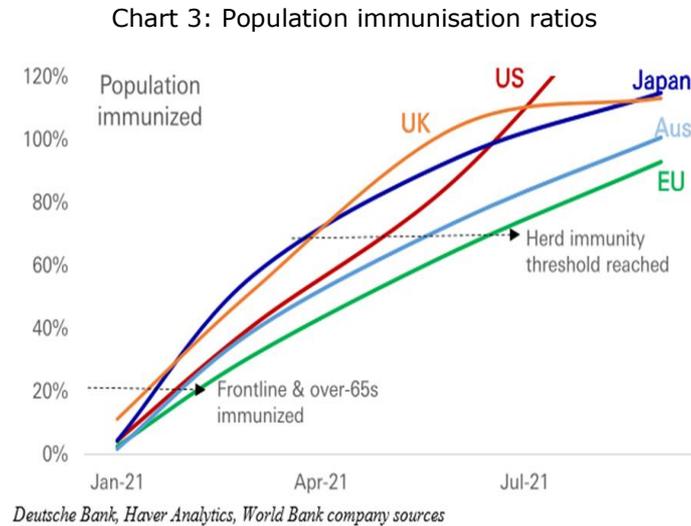

Chart 2: MOVE Index of US Treasury Volatility

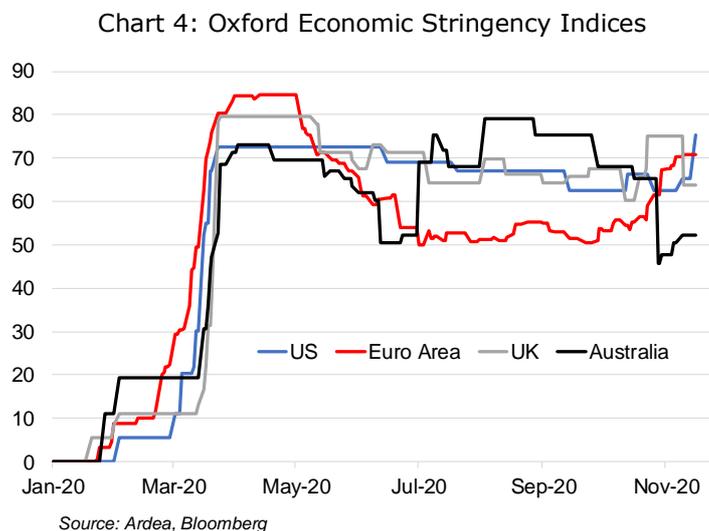

Source: Ardea, Bloomberg

2) Vaccine test results offer investors hope

While November started with intense focus on politics, positive news on vaccines ultimately dominated sentiment and price action. Three vaccine candidates reported test results at the upper end of expectations, showing up to 95% effectiveness against COVID in trials. As a result, market participants are starting to imagine a return to a more normal world economy. Chart 3 shows an example of a bullish immunisation projection in November, which suggests herd immunity for many G10 countries could be reached as soon as mid-2021.

The vaccine news was very timely for markets, which in early November were confronting high case numbers and renewed lockdowns in Europe and the US. This renewed COVID wave threatened to derail the recovery narrative that had taken hold over previous months. Chart 4 shows economic stringency indices – which measure the extent of lockdowns and social distancing measures – are still a very long way from normal.

3) Central banks keep low rate support in place

A key anchor holding bond yields down is the continued highly accommodative stance of central bank policy. November featured some notable policy signals from central banks:

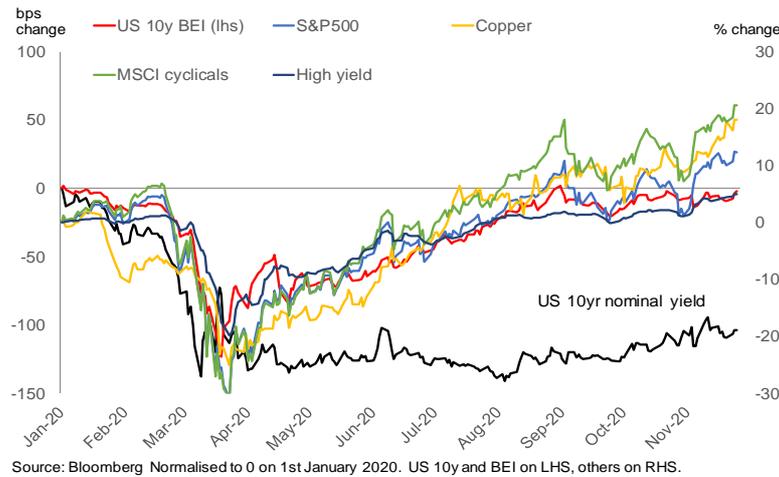

- **US Federal Reserve:** The FOMC minutes revealed a lengthy discussion about potential changes to the pace and composition of asset purchases. Many market participants expect the Fed to extend the average maturity of asset purchases in December.
- **European Central Bank:** ECB President Lagarde indicated a preference to further easing via bond purchases, rather than an extension of negative rate policies. Further easing is expected by December.

- **Bank of England:** BoE announced a larger than expected £150bn increase in quantitative easing (QE).
- **Reserve Bank of Australia:** The RBA implemented rate cuts, extra cheap bank financing and a quantity-based QE program for the first time.
- **Reserve Bank of New Zealand:** The RBNZ added further stimulus via cheap loans to banks but hinted at a lower willingness for negative rates.

Why is it relevant?

In recent reports, we have discussed how prospects for a recovery from COVID and confidence in a structurally low inflation outlook have contributed to risk asset strength and well contained nominal bond yields. As Chart 5 shows, this divergence has extended in the last month, although the inflation expectation component of long-term yields has more closely tracked the path of risk assets than nominal yields (via steeply negative *real yields*).

Chart 5: Various asset class movements from January to end November

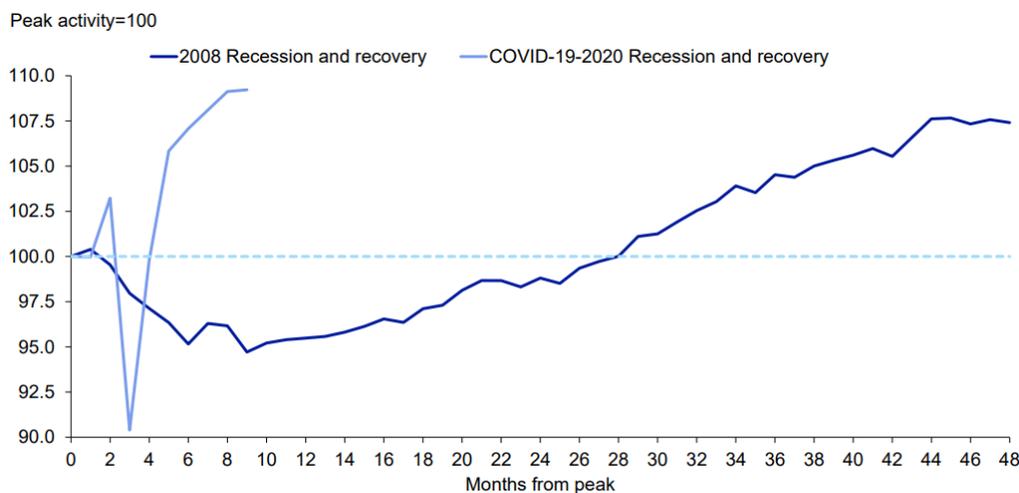

Underpinning the risk asset and bond yield divergence are assumptions about what 2021 holds for the global economy. We outline a few of these key themes.

1) Markets anticipate a remarkable turnaround in growth

2020 has seen the sharpest decline in global output in around 100 years by some estimates. The IMF expects global real GDP growth to finish the year down around 4.7%. For 2021, growth is forecast to rebound by 4.8%. Both the depth and speed of recovery in growth from the COVID recession stand in stark contrast with previous global recessions, such as in 2008. Indeed, as Deutsche Bank research recently pointed out, some facets of the global economy have shown very strong "V-shaped" rebounds, such as US retail spending (Chart 6). This kind of bounce in spending speaks to the huge volume of government support for households.

Chart 6: US retail sales after a recession - 2020 vs 2008

Note: Peak activity for 2008 recession defined as June 2008; Peak activity for 2020 recession defined as January 2020
Source: US Census Bureau, Deutsche Bank

There are big assumptions underlying bullish 2021 forecasts, especially around the effectiveness and pace of COVID vaccines, which are critical to economies opening back up. There are plenty of risks to the positive consensus outlook, such as logistical problems, population aversion to vaccines or the virus mutating. The emergence or not of these risks will be critical for risk appetite and demand for safe-haven sovereign bonds in the coming months.

2) Economic scars from COVID and low inflation

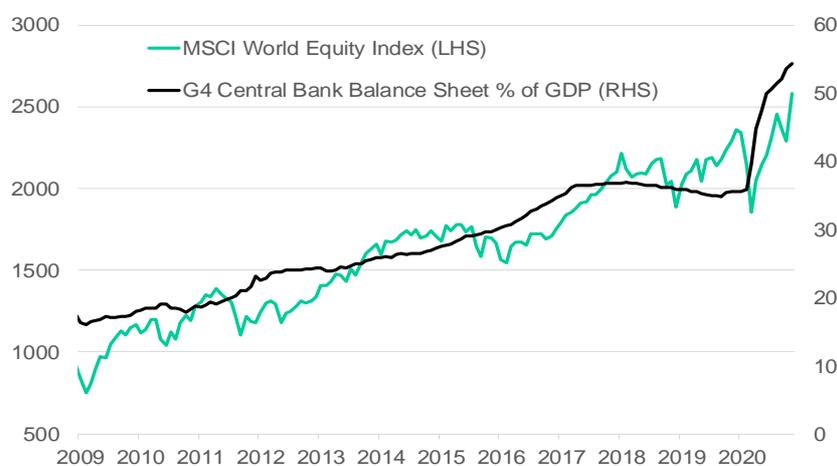

A strong prospective year-on-year rebound in GDP growth masks a lot of underlying weakness. Growth will remain well under the pre-COVID trend, while balance sheets and labour markets are generally not forecast to recover as quickly. International mobility will also be impacted for longer, which makes for a particularly difficult outlook in countries with higher dependence on tourism and immigration. This backdrop supports a low inflation consensus among economists. Even before COVID, many central banks were struggling to navigate structural forces driving a lower sensitivity of inflation to falling unemployment. These sorts of challenges haven't gone away, even if markets are focusing more on the bounce in headline growth.

3) Central banks will maintain highly accommodative policies

Central banks have gone all-in with policy measures this year, having taken rates to their respective effective lower bounds. Expectations of a lift in official cash rates have been pushed beyond the next year across markets. The Fed and RBA have recently said they will need to see inflation at or above target before considering any policy tightening. (See [here](#) for more detail on the RBA's latest policy changes and implications for investors).

Balance sheet growth has exploded in 2020, by over \$8tn among the largest central banks. The near-term outlook is for more of the same, which is providing all assets with a big boost. Longer term, there is a risk any prospective pull-back in support could shake this cosy low yield and strong risk asset dynamic.

Chart 7: Massive central bank balance sheet growth has supported asset prices

Source: Ardea, Bloomberg

4) Fiscal policy support is a big potential swing factor

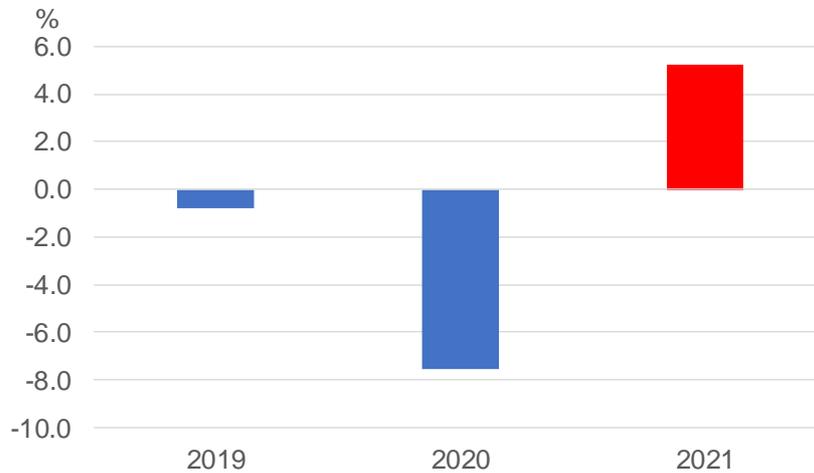

At the height of the global crisis in March, we wrote about the shift in market importance from monetary to fiscal policy (see [here](#) for more details). Governments have significantly supported economies in the wake of the massive drag from COVID shutdowns through a mix of direct payments to households and businesses and guarantee structures. The recession would undoubtedly be much more severe if aggressive action hadn't been taken (some estimates put the contraction at as much as double what has been experienced).

Through 2021, the prospects of economies re-opening also raise the risk of fiscal support being removed too early. Fiscal tightening through 2011 to 2015 hindered the recovery from the global financial crisis. The stakes this time around are massive and so is the risk of a policy mistake. Chart 8 shows the IMF's estimate of a turn in the fiscal thrust next year if enacted policies across the world are allowed to roll-off. But the IMF also point out the ample room for upside surprises to growth if policies are extended.

Fiscal policy is especially critical for the bond market, where a massive rise in issuance in 2020 contributed to

steepening pressure at the long end of yield curves (see [here](#) for a more detailed discussion). With deficits still massive, the volume of issuance will still be large in 2021 (even if incrementally it's less than this year). Central bank purchases are set to eclipse issuance in some countries, but not others, while the distribution of purchases compared to issuance varies greatly across markets. These mismatches create cross-market and within market relative value distortions – a theme that is set to remain in place for the foreseeable future (outlined in more detail [here](#)).

How are we positioned?

The portfolio's return for the month was positive.

Performance is driven by strategies that exploit specific 'relative value' (RV) mispricing between closely related fixed income securities. This is done in a way that isolates the RV mispricing from broader market movements, while maintaining minimal interest rate duration exposure and excluding all credit investments. Consequently, the portfolio's performance is not driven by the macroeconomic factors or market movements that dominate conventional fixed income strategies and therefore exhibits minimal correlation to broader government bond, credit and equity markets.

The portfolio is intentionally constructed with many modestly sized and diverse RV strategies that collectively contribute to overall portfolio performance. As the portfolio contains hundreds of individual positions, the commentary below focuses on just a few of the more noteworthy RV themes that contributed to performance over the period. (Further detail on the Fund's pure 'relative value' investment approach is available [here](#).)

Noteworthy positive performance for the month came from the following strategy groups:

- RV Bonds vs Derivatives

Long positions in semis, particularly in maturities slightly longer than 10y, outperformed duration hedges. These trades benefited from the improved demand from RBA QE and the lower yield outlook at the front end of the AUD curve supported reach for extra yield in semis over government bonds. The improved demand from the RBA and investors offset some modest underperformance following state budget results, which confirmed significant fiscal deterioration and increased bond supply.

Long positions in ultra-long maturity EUR semis, implemented via options, outperformed paid swap hedges. The generally positive global risk backdrop and expectation of further central bank stimulus supported demand for EUR semis.

Ultra-long maturity Australian government bonds outperformed swaps. The move in this spread was helped by non-government issuance hedging flows which pushed long term swap rates higher relative to equivalent maturity bond yields.

- RV Curve

The AUD curve steepened through the month as the positive risk and economic news from the COVID vaccine trials drove an underperformance in long-dated vs shorter dated bonds and swaps. The portfolio held long positions in the 3-5 year part of the curve, relative to short positions in longer dated maturities.

The portfolio benefited from paying longer tenor AUD 6m vs 3m domestic swap basis and these spreads lifted through the month.

UK inflation swap steepeners were implemented beyond 10y to take advantage of unusual inversion in the curve. These trades benefited in November from a correction higher in long-dated inflation pricing as liability-driven investment demand re-emerged after the government released consultation on the Retail Prices Index (RPI) reform.

The portfolio held US inflation curve relative value trades in less than 10y maturities, across inflation-linked bonds and swaps. These positions benefited from a steepening in the inflation curve.

Noteworthy negative performance for the month came from the following strategy groups:

- **Volatility**

Long volatility positions in AUD and EUR options underperformed through the month. Despite the emergence of significant positive and negative risks to the macro outlook, implied rates volatility fell as central bank policy expectations constrained trading ranges across yield curves with low rate guidance and QE.

Ardea Real Outcome Fund RV attribution categories

RV Rates: The portfolio consists of hundreds of individual long / short bond and derivatives positions, each with their own interest rate duration exposure. These positions are designed to offset each other and are constantly rebalanced to minimise duration exposure, so that the portfolio is not overly exposed to general fluctuations in the level of market rates.

RV Micro Curve: These RV strategies exploit pricing inconsistencies between different points on interest rate curves by taking a 'long' position in one point vs. a 'short' position in another, such that the overall trade has zero net interest rate duration. We focus specifically on curve points that are highly correlated with each other, which typically means they are close to each other.

Volatility: ARO's portfolio is always positioned structurally 'long volatility', which is expressed via buying interest options. This means the portfolio benefits when the market pricing of interest rate volatility increases (explained in more detail [here](#)).

RV Bond vs Derivative: These RV strategies exploit pricing inconsistencies between government bonds and closely related interest rate derivatives by taking a 'long' position in one vs. a 'short' position in the other, such that the overall trade is duration neutral.
